

HR Attrition Analytics Dashboard

Task 20 • Professional project report • Power BI / Excel workflow

Objective

Build a management dashboard showing attrition by department, role and tenure, then convert the HR dataset into actionable management insights.

Dataset quality

The dataset contains 1,470 employee records and 35 source fields. No missing values were detected. The presentation-facing CSV excludes EmployeeNumber while preserving the analytical fields required for segmentation.

Metric	Result
Total Employees	1,470
Attritions	237
Overall Attrition Rate	16.1%
Average Monthly Income	\$6,503
Overtime Attrition Rate	30.5%

Five management insights

- Overall attrition is 16.1% (237 of 1470 employees), establishing the baseline for all segment comparisons.
- Sales has the highest department attrition at 20.6%, compared with 17.8% across the three departments.
- Sales Representatives are the highest-risk role at 39.8%, followed by Laboratory Technicians at 23.9%.
- Overtime is strongly associated with attrition: 30.5% for employees working overtime versus 10.4% for those who do not.
- Early tenure is the clearest tenure signal: employees with 0–1 years at the company have 34.9% attrition, while 11–20 years is only 6.7%.

Recommended dashboard layout

- KPI cards: Total Employees, Attritions, Attrition Rate, Average Monthly Income, Overtime Attrition Rate.
- Department view: compare attrition rates rather than counts alone.
- Role view: highlight high-risk roles and their employee volumes.
- Tenure view: identify early-tenure risk and retention opportunities.
- Slicers: Department, Job Role, Overtime, Business Travel and Tenure Bucket.

Interpretation note

These are observational workforce patterns, not proof of causation. HR teams should validate the strongest signals with policy context, employee feedback and longitudinal analysis before making retention decisions.
